

CamDiag Release Assurance Register

Technical assurance status and human approval register | 15 July 2026

Status date: 2026-07-15

Build: 8915971

Environment: Firebase project camdiag-c7e78

Technical controls verified

Control	Evidence	Status
Enterprise OCR	Processor aaaaa618e37f119b, type OCR_PROCESSOR, stable default v2.1	Complete
Runtime access	Default Functions service account has roles/documentai.apiUser	Complete
App Check client	reCAPTCHA Enterprise score key registered for approved production domains	Complete
App Check services	Firestore, Authentication and Storage report ENFORCED	Complete
Custom API enforcement	APP_CHECK_ENFORCED=true; unauthenticated/unattested transcription request returns HTTP 401	Complete
Audit retention	Firestore TTL on audit_logs.expiresAt reports ACTIVE; application retention is 90 days	Complete
Backend deployment	Cloud Function api updated 2026-07-15 and health endpoint returns HTTP 200	Complete
Hosting deployment	Firebase Hosting and App Hosting URLs return HTTP 200	Complete
Source release	Commit 8915971 on codex/release-document-ocr	Complete

Required human approvals

These are governance decisions and cannot be self-certified by software or an AI agent.

Approval	Required signatory	Required evidence	Status
Clinical validation	Cameroon-licensed clinical lead plus independent licensed reviewer	Frozen de-identified dataset, ground truth, error analysis and blocking-defect disposition	Awaiting dataset/reviewers
Privacy impact assessment	Data Protection Officer or appointed privacy lead	Data map, lawful basis, minimization, retention, subject-rights and breach process	Awaiting signature
Regulatory classification	Qualified Cameroon medical-device/regulatory counsel	Intended-use classification and authorization/pilot determination	Awaiting opinion

Approval	Required signatory	Required evidence	Status
Data residency	Controller/DPO and security owner	Approved regions, subprocessors, transfer mechanism and storage/backup map	Awaiting approval
Security risk acceptance	Security owner	Threat model, penetration test, incident response and residual-risk acceptance	Awaiting testing/signature
Clinical safety case	Clinical safety officer	Hazard log, safety controls, validation traceability and release authorization	Awaiting signature

Clinical handwriting validation execution package

1. Collect de-identified documents under an approved protocol; never use live patient data without authorization.
2. Use at least 100 prescriptions with legible, difficult and ambiguous handwriting in English and French.
3. Freeze a manifest containing document hash, source class, language, quality class and two-clinician adjudicated ground truth.
4. Run the deployed OCR processor without manual correction and separately record the post-review corrected result.
5. Report word error rate and exact-match accuracy for medication name, strength, dose, decimal, unit, route, frequency, duration, allergy and date.
6. Every dangerous substitution, decimal/unit error or missed allergy is a blocking safety event regardless of aggregate score.
7. Repeat disagreement adjudication with a third licensed reviewer.
8. Attach signed reviewer records and approval decision to this register.

Release decision

Technical deployment is complete. Clinical production use remains not approved until every human approval above is signed. The deployed application must remain an investigational clinician-review tool and must not be represented as validated autonomous diagnosis or prescribing software.
